Privacy is an important issue, and with the current trend in computing, moreso than ever. The DIGOS Ambassador (hereafter ("Amby", "The Bot", or "The DIGOS Ambassador")) is developed in the European Union, and processes global data from both inside and outside of it – as such, this document is here to ensure that you understand what, where, and why it keeps some of your personal data around. My goal is to have a GDPR-compliant privacy document for Amby's users to refer to.

The document is organized into sections roughly based on https://gdprchecklist.io/. Please refer to the table of contents for easier browsing.

Your Data

In order to function properly and be able to provide services to you as a user, Amby needs to store certain types of data about you and content you have generated on the Discord platform. This data may be used to associate you with content generated by you, or by other users of the bot, and can potentially be used to identify you as a person. The data is stored in a digital database, accessible only to authorized individuals via the bot's features, or database management software used during development of the software.

Amby stores the following Potentially Personally Identifiable Data (hereafter "PPI", "PPID", or "PPI Data"). Unless otherwise stated, no information is shared with any third parties, and is kept indefinitely (or until you request the deletion of your user).

User Account

Your *Discord ID* – upon your first interaction with the bot (e.g, running a command), a user is automatically created for you. This user is used as your primary ownership point for various features in the bot, such as roleplays, characters, or similar. In order to map this user to your Discord account, your unique Discord ID is stored. This data is stored as a simple number.

Your *Discord Servers* - in order to keep your user data separate between servers, your user ID is stored together with the server that the user was created on. A new user is created for every server you use the bot on. Similar to your Discord ID, the Discord server is also a simple number.

Whether or not your Discord Servers are considered *Not Safe for Work* – to make content filtering easier, the bot also tracks whether or not a server is marked as being NSFW, and may contain explicit sexual content.

User Messages

Your *Discord Nickname* – as a part of the roleplay replay and save functionality in the bot, your Discord nickname that was in use at the time of a roleplay may be stored. No information about your nickname is stored until you send a message that is included in a roleplay.

This data may be accessed by anyone using the bot in the same server as you, or (depending on roleplay-unique settings) a subset of users that participate in the same roleplay as you.

Your *Message Contents* – also as a part of the roleplay replay and save functionality, the contents of messages considered part of a roleplay are also stored. The text content of the message is stored in its entirety, with no changes. If you edit a message that's tracked while the associated roleplay is active, the edit is propagated to the stored data. No message contents outside of roleplays are ever stored.

This data may be accessed by anyone using the bot in the same server as you, or (depending on roleplay-unique settings) a subset of users that participate in the same roleplay as you.

Your *Discord ID* – your ID is, again, stored. The ID is stored separately from your user account on a per-message basis.

A *Timestamp* – additionally, in order to allow correct ordering of messages, the time at which the message was sent is stored.

Personal Preferences and Content

Your *Specific Sexual Preferences* – the kink module in Amby can be used to store a list of a user's specific sexual preferences for use with comparing compatibility between users at their discretion. No information is collected automatically, and preferences must be manually entered by the user.

This data may be accessed by anyone using the bot in the same server as you. You may also restrict this to persons on your Discord friends list.

Your *Pronoun Preferences* – characters may have a pronoun preference associated with them, and your characters are associated with your user.

This data may be accessed by anyone using the bot in the same server as you.

Your *Images* – users are able to upload arbitrary images that can be associated with characters they own. The bot does not store the images themselves, but rather the URL that points to them on the Discord Content Delivery Network.

This data may be accessed by anyone using the bot in the same server as you.

Accountability & Management

While Amby's data storage and processing is far from as expansive and invasive as many other actors, there is still an element of sensitive and very personal data that may be stored with the bot.

There is no legal requirement (under the GDPR) for a Data Protection Officer (hereafter "DPO") to be appointed in this case, however, all personal information that the bot stores will be known to one or more individuals. As such, any questions related to data protection, EU regulations, sensitive data handling, and related issues should be directed to the individual running the instance of the bot that you interact with, or their appointed individual.

Data breaches (which we'll hopefully never have) are reported to local authorities within 72 hours of the breach, and a full report on lost data, consequences, and countermeasures will be made public within a week of the breach.

New Rights

Under the GDPR, you as a user have several rights that you can exert over your data. All of these rights exhibit themselves in the form of various data handling requests that can be made to the privacy contact individual. Primarily, you can

- Request access to your personal information

- Request deletion of your personal information

- Request preventing of processing your personal information

- Request delivery of your personal information

Any requests direct to the privacy contact individual should include the full request (e.g, what you want), proof of identification (so that we don't give your data to someone else), and if applicable, where to send it.

Consent

You as a user must consent to the handling and storage defined above. Without it, Amby cannot legally store any of your data, or process any of your requests.

By default, this happens the first time you run a command from the bot. She'll DM you with instructions.

If you'd rather do it manually, you can consent to handling and processing of your data under the above conditions by issuing a command to the bot over direct message.

*To grant consent, execute **!privacy grant-consent***

*To revoke consent, execute **!privacy revoke-consent***

You can get a copy of this privacy policy at any time by issuing another command to the bot over DM.

*To get a copy of this policy, execute **!privacy policy***
